

INTERNSHIP PROJECT PRESENTATION

E-Commerce FAQ Chatbot & Language Translation Tool
School of Computer Science and Engineering
IILM University, Greater Noida, U.P.

AYUSHI KUSHWAH | ROLL NO. 25SCS1003001205
SECTION 2CSE1 | B.TECH CSE | BATCH 2026-27

Internship Overview

PROJECT

Python-based projects developed during the internship

- 1. E-Commerce FAQ Chatbot
- 2. Language Translation Tool
- Focus: Python, NLP, GUI development and practical application design

Project 1: FAQ Chatbot

- Purpose: answer common e-commerce customer questions
- FAQ dataset contains questions and predefined answers
- Topics include order tracking, returns, payment, shipping, password reset and support
- Interactive interface is created using Gradio

FAQ Chatbot – Technologies

- Python
- NLTK: tokenization, stop-word removal and lemmatization
- Pandas: dataset management
- Scikit-learn: TF-IDF and cosine similarity
- Gradio: chat interface

FAQ Chatbot – Methodology

- User enters a question
- NLP preprocessing cleans the query
- TF-IDF converts text into numerical vectors
- Cosine similarity compares the query with FAQ questions
- Best match is selected; threshold 0.2 controls fallback
- Relevant answer or fallback message is returned

Project 2: Language Translation Tool.

PROJECT

Translation application built with Tkinter

- Source language can be Auto-Detect or selected from the list
- Target languages include English, Spanish, French, German, Hindi, Chinese, Japanese, Korean, Italian, Russian and Arabic
- Translated text is displayed in a read-only output area
- Copy-to-Clipboard feature is included

Translation Tool – Working

- 1. Select source and target language
- 2. Enter text
- 3. Validate that input is not empty
- 4. GoogleTranslator performs translation
- 5. Result is displayed
- 6. User can copy the translated output

Skills Gained

- Python programming and modular code organization
- Natural Language Processing fundamentals
- TF-IDF and cosine similarity
- Working with datasets using Pandas
- Building interfaces with Gradio and Tkinter
- Input validation and exception handling
- Understanding external translation services

Conclusion

- The two projects demonstrate practical Python application development
- The chatbot shows how classical NLP can support FAQ automation
- The translation tool demonstrates GUI-based interaction with a translation service
- Both projects provide a foundation for future enhancement and larger applications

Thank You
